COMPLEX NUMBER

1. **DEFINITION:**

Complex numbers are defined as expressions of the form a+ib where a, $b\in R$ & $i=\sqrt{-1}$. It is denoted by z i.e. z = a + ib. 'a' is called real part of z (Re z) and 'b' is called imaginary part of z (Im z).

Every Complex Number Can Be Regarded As

Note:

- The set R of real numbers is a proper subset of the Complex Numbers. Hence the Complex Number (i) system is $N \subset W \subset I \subset Q \subset R \subset C$.
- (ii) Zero is both purely real as well as purely imaginary but not imaginary.
- $i = \sqrt{-1}$ is called the imaginary unit. Also i = -1; $i^3 = -i$; $i^4 = 1$ etc. (iii) In general $i^{4n} = 1$, $i^{4n+1} = i$, $i^{4n+2} = -1$, $i^{4n+3} = -i$, where $n \in I$
- $\sqrt{a} \sqrt{b} = \sqrt{ab}$ only if atleast one of either a or b is non-negative. (iv)

Illustration 1: The value of $i^{57} + 1/i^{125}$ is :-

(A) 0

- (B) -2i
- (C) 2i

(D) 2

Solution:
$$i^{57} + 1/i^{125} = i^{56}$$
. $i + \frac{1}{i^{124}}$.

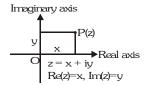

$$= \left(i^4\right)^{14} i + \frac{1}{\left(i^4\right)^{31} i}$$

$$=i+\frac{1}{i}=i+\frac{i}{i^2}=i-i=0$$

Ans. (A)

2. ARGAND DIAGRAM:

Master Argand had done a systematic study on complex numbers and represented every complex number z = x + iy as a set of ordered pair (x, y) on a plane called complex plane (Argand Diagram) containing two perpendicular axes. Horizontal axis is known as Real axis & vertical axis is known as Imaginary axis. All complex numbers lying on the real axis are called as purely real

and those lying on imaginary axis as purely imaginary.

3. ALGEBRAIC OPERATIONS:

Fundamental operations with complex numbers :

- (a) Addition
- (a + bi) + (c + di) = (a + c) + (b + d)i
- Subtraction (b)
- (a + bi) (c + di) = (a c) + (b d)i
- (c) Multiplication
- (a + bi) (c + di) = (ac bd) + (ad + bc)i
- (d) Division
- $\frac{a+bi}{c+di} = \frac{a+bi}{c+di} \cdot \frac{c-di}{c-di} = \frac{ac+bd}{c^2+d^2} + \frac{bc-ad}{c^2+d^2}i$

Note:

- The algebraic operations on complex numbers are similar to those on real numbers treating i as (i) a polynomial.
- (ii) Inequalities in complex numbers (non-real) are not defined. There is no validity if we say that complex number (non-real) is positive or negative.
 - e.g. z > 0, 4 + 2i < 2 + 4i are meaningless.
- In real numbers, if $a^2 + b^2 = 0$, then a = 0 = b but in complex numbers, $z_1^2 + z_2^2 = 0$ does not imply (iii) $z_1 = z_2 = 0.$

Illustration 2: $\frac{3+2i\sin\theta}{1-2i\sin\theta}$ will be purely imaginary, if $\theta =$

(A)
$$2n\pi \pm \frac{\pi}{3}$$
, $n \in I$ (B) $n\pi + \frac{\pi}{3}$, $n \in I$ (C) $n\pi \pm \frac{\pi}{3}$, $n \in I$

(B)
$$n\pi + \frac{\pi}{3}, n \in I$$

(C)
$$n\pi \pm \frac{\pi}{3}$$
, $n \in I$

(D) none of these

 $\frac{3+2i\sin\theta}{1-2i\sin\theta}$ will be purely imaginary, if the real part vanishes, i.e., Solution:

$$\frac{(3+2i\sin\theta)}{(1-2i\sin\theta)}\times\frac{(1+2i\sin\theta)}{(1+2i\sin\theta)}\;=\;\frac{\left(3-4\sin^2\theta\right)+i\left(8\sin\theta\right)}{\left(1+4\sin^2\theta\right)}$$

$$\frac{3-4\sin^2\theta}{1+4\sin^2\theta} = 0 \qquad \Rightarrow \quad 3-4\sin^2\theta = 0 \text{ (only if } \theta \text{ be real)}$$

$$\Rightarrow \sin^2\!\theta = \left(\frac{\sqrt{3}}{2}\right)^2 = \left(\sin\frac{\pi}{3}\right)^2$$

$$\Rightarrow \theta = n\pi \pm \frac{\pi}{3}, n \in I$$

Do yourself - 1:

- Determine least positive value of n for which $\left(\frac{1+i}{1-i}\right)^n = 1$ (i)
- Find the value of the sum $\sum_{n=1}^{5} (i^n + i^{n+2})$, where $i = \sqrt{-1}$. (ii)

3. EQUALITY IN COMPLEX NUMBER:

Two complex numbers $z_1 = a_1 + ib_1 & z_2 = a_2 + ib_2$ are equal if and only if their real & imaginary parts are respectively equal.

Illustration 3: The values of x and y satisfying the equation $\frac{(1+i)x-2i}{3+i} + \frac{(2-3i)y+i}{3-i} = i$ are

(A)
$$x = -1$$
, $y = 3$

(A)
$$x = -1$$
, $y = 3$ (B) $x = 3$, $y = -1$ (C) $x = 0$, $y = 1$ (D) $x = 1$, $y = 0$

(C)
$$y = 0$$
 $y = 1$

(D)
$$x = 1$$
, $y = 0$

 $\frac{(1+i)x-2i}{3+i} + \frac{(2-3i)y+i}{3-i} = i \implies (4+2i) \times + (9-7i) \times - 3i - 3 = 10i$ Solution :

Equating real and imaginary parts, we get 2x - 7y = 13 and 4x + 9y = 3.

Hence x = 3 and y = -1.

Ans.(B)

Illustration 4: Find the square root of 7 + 24 i.

Solution: Let
$$\sqrt{7+24i}$$
 = a + ib

Squaring
$$a^2 - b^2 + 2iab = 7 + 24i$$

Compare real & imaginary parts $a^2 - b^2 = 7$ & 2ab = 24

By solving these two equations

We get
$$a = \pm 4$$
, $b = \pm 3$

$$\sqrt{7+24i} = \pm (4+3i)$$

Illustration 5: If $x = -5 + 2\sqrt{-4}$, find the value of $x^4 + 9x^3 + 35x^2 - x + 4$.

Solution: We have,
$$x = -5 + 2\sqrt{-4}$$

$$\Rightarrow$$
 x + 5 = 4i \Rightarrow (x + 5)² = 16i²

$$\Rightarrow$$
 $x^2 + 10x + 25 = -16 \Rightarrow x^2 + 10x + 41 = 0$

Now,

$$x^4 + 9x^3 + 35x^2 - x + 4$$

$$\Rightarrow$$
 $x^2(x^2 + 10x + 41) - x(x^2 + 10x + 41) + 4(x^2 + 10x + 41) - 160$

$$\Rightarrow$$
 $x^2(0) - x(0) + 4(0) - 160 \Rightarrow $-160$$

Ans.

Do yourself - 2:

- (i) Find the value of $x^3 + 7x^2 x + 16$, where x = 1 + 2i.
- (ii) If $a + ib = \frac{c+i}{c-i}$, where c is a real number, then prove that : $a^2 + b^2 = 1$ and $\frac{b}{a} = \frac{2c}{c^2 1}$.
- (iii) Find square root of -15 8i

4. THREE IMPORTANT TERMS: CONJUGATE/MODULUS/ARGUMENT:

(a) CONJUGATE COMPLEX:

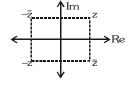

If z = a + ib then its conjugate complex is obtained by changing the sign of its imaginary part & is denoted by \overline{z} . i.e. $\overline{z} = a - ib$.

Note that:

(i)
$$z + \overline{z} = 2 \operatorname{Re}(z)$$

(ii)
$$z - \overline{z} = 2i \text{ Im}(z)$$

- (iii) $z\overline{z} = a + b$, which is purely real
- (iv) If z is purely real, then $z \overline{z} = 0$
- (v) If z is purely imaginary, then $z + \overline{z} = 0$
- (vi) If z lies in the 1^{st} quadrant, then \overline{z} lies in the 4^{th} quadrant and $-\overline{z}$ lies in the 2^{nd} quadrant.

(b) Modulus

If P denotes complex number z = x + iy, then the length OP is called modulus of complex number z. It is denoted by |z|.

$$OP = |z| = \sqrt{x^2 + y^2}$$

Geometrically |z| represents the distance of point P from origin. ($|z| \ge 0$)

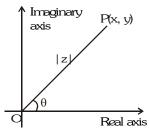

Note: Unlike real numbers, $|z| = \begin{bmatrix} z & \text{if } z > 0 \\ -z & \text{if } z < 0 \end{bmatrix}$

is not correct.

(c) Argument or Amplitude:

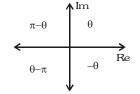

If P denotes complex number z = x + iy and if OP makes an angle θ with real axis, then θ is called one of the arguments of z.

Note:

- (i) Argument of a complex number is a many valued function. If θ is the argument of a complex number, then $2n\pi + \theta$; $n \in I$ will also be the argument of that complex number. Any two arguments of a complex number differ by $2n\pi$.
- (ii) The unique value of θ such that $-\pi < \theta \le \pi$ is called **Amplitude (principal value of the argument).**
- (iii) Principal argument of a complex number z = x + iy can be found out using method given below:
 - (a) Find $\theta = \tan^{-1} \left| \frac{y}{x} \right|$ such that $\theta \in \left(0, \frac{\pi}{2} \right)$.

- (b) Use given figure to find out the principal argument according as the point lies in respective quadrant.
- (iv) Unless otherwise stated, amp z implies principal value of the argument.
- (v) The unique value of $\theta = \tan^{-1} \frac{y}{x}$ such that $0 < \theta \le 2\pi$ is called **least positive argument.**
- (vi) If z = 0, arg(z) is not defined
- (vii) If z is real & negative, $arg(z) = \pi$.
- (viii) If z is real & positive, arg(z) = 0
- (ix) If $\theta = \frac{\pi}{2}$, z lies on the positive side of imaginary axis.
- (x) If $\theta = -\frac{\pi}{2}$, z lies on the negative side of imaginary axis.

By specifying the modulus & argument a complex number is defined completely. Argument impart direction & modulus impart distance from origin.

For the complex number 0 + 0i the argument is not defined and this is the only complex number which is given by its modulus only.

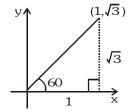

Illustration 6: Find the modulus, argument, principal value of argument, least positive argument of complex numbers (a) $1 + i\sqrt{3}$ (b) $-1 + i\sqrt{3}$ (c) $1 - i\sqrt{3}$ (d) $-1 - i\sqrt{3}$

Solution :

(a) For
$$z = 1 + i\sqrt{3}$$

$$|z| = \sqrt{1^2 + (\sqrt{3})^2} = 2$$

$$arg (z) = 2n\pi + \frac{\pi}{3}, \quad n \in I$$

Least positive argument is $\frac{\pi}{3}$

If the point is lying in first or second quadrant then amp(z) is taken in anticlockwise direction.

In this case amp(z) = $\frac{\pi}{3}$

 $(-1,\sqrt{3})$

(b) For
$$z = -1 + i\sqrt{3}$$

 $|z| = 2$

$$arg (z) = 2n\pi + \frac{2\pi}{3}, n \in I$$

Least positive argument = $\frac{2\pi}{3}$

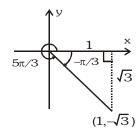

$$amp(z) = \frac{2\pi}{3}$$

(c) For
$$z = 1 - i\sqrt{3}$$

$$|z| = 2$$

$$arg (z) = 2n\pi - \frac{\pi}{3}, n \in I$$

Least positive argument = $\frac{5\pi}{3}$

If the point lies in third or fourth quadrant then consider amp(z) in clockwise direction.

In this case amp(z) = $-\frac{\pi}{3}$

(d) For
$$z = -1 - i\sqrt{3}$$

 $|z| = 2$

$$arg (z) = 2n\pi - \frac{2\pi}{3}, n \in I$$

Least positive argument = $\frac{4\pi}{3}$

$$amp(z) = -\frac{2\pi}{3}$$

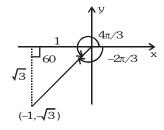

Illustration 7: Find modulus and argument for $z = 1 - \sin \alpha + i \cos \alpha$, $\alpha \in (0,2\pi)$

Solution: $|z| = \sqrt{(1-\sin\alpha)^2 + (\cos\alpha)^2} = \sqrt{2-2\sin\alpha} = \sqrt{2} \left|\cos\frac{\alpha}{2} - \sin\frac{\alpha}{2}\right|$

Case (i) For $\alpha \in \left(0, \frac{\pi}{2}\right)$, z will lie in I quadrant.

$$\text{amp (z)} = \tan^{-1}\frac{\cos\alpha}{1-\sin\alpha} \Rightarrow \quad \text{amp (z)} = \tan^{-1}\frac{\cos^2\frac{\alpha}{2}-\sin^2\frac{\alpha}{2}}{\left(\cos\frac{\alpha}{2}-\sin\frac{\alpha}{2}\right)^2} = \tan^{-1}\frac{\cos\frac{\alpha}{2}+\sin\frac{\alpha}{2}}{\cos\frac{\alpha}{2}-\sin\frac{\alpha}{2}}$$

$$\Rightarrow$$
 arg $z = tan^{-1} tan \left(\frac{\pi}{4} + \frac{\alpha}{2} \right)$

Since
$$\frac{\pi}{4} + \frac{\alpha}{2} \in \left(\frac{\pi}{4}, \frac{\pi}{2}\right)$$

amp (z) is not defined.

$$\therefore \text{ amp (z)} = \left(\frac{\pi}{4} + \frac{\alpha}{2}\right), \mid z \mid = \sqrt{2} \left(\cos \frac{\alpha}{2} - \sin \frac{\alpha}{2}\right)$$

Case (ii)
$$\text{at } \alpha = \frac{\pi}{2}: \quad z = 0 + 0 \mathrm{i}$$

$$|z| = 0$$

Case (iii) For
$$\alpha \in \left(\frac{\pi}{2}, \frac{3\pi}{2}\right)$$
, z will lie in IV quadrant

so amp (z) =
$$-\tan^{-1}\tan\left(\frac{\alpha}{2} + \frac{\pi}{4}\right)$$

Since
$$\frac{\alpha}{2} + \frac{\pi}{4} \in \left(\frac{\pi}{2}, \pi\right)$$

$$\therefore \text{ amp (z)} = -\left(\frac{\alpha}{2} + \frac{\pi}{4} - \pi\right) = \frac{3\pi}{4} - \frac{\alpha}{2}, |z| = \sqrt{2}\left(\sin\frac{\alpha}{2} - \cos\frac{\alpha}{2}\right)$$

Case (iv)
$$\text{at } \alpha = \frac{3\pi}{2}: \qquad z=2+0i$$

$$|z|=2$$

$$\text{amp } (z)=0$$

Case (v) For
$$\alpha \in \left(\frac{3\pi}{2}, 2\pi\right)$$

z will lie in I quadrant

$$arg (z) = tan^{-1}tan \left(\frac{\alpha}{2} + \frac{\pi}{4}\right)$$

Since
$$\frac{\alpha}{2} + \frac{\pi}{4} \in \left(\pi, \frac{5\pi}{4}\right)$$

$$\therefore \text{ arg } z = \frac{\alpha}{2} + \frac{\pi}{4} - \pi = \frac{\alpha}{2} - \frac{3\pi}{4} \ , \ |z| = \sqrt{2} \left(\sin \frac{\alpha}{2} - \cos \frac{\alpha}{2} \right)$$

5. REPRESENTATION OF A COMPLEX NUMBER IN VARIOUS FORMS:

(a) Cartesian Form (Geometrical Representation) :

Every complex number z = x + i y can be represented by a point on the cartesian plane known as complex plane by the ordered pair (x , y). There exists a one-one correspondence between the points of the plane and the members of the set of complex numbers.

For
$$z = x + iy$$
; $|z| = \sqrt{x^2 + y^2}$; $\overline{z} = x - iy$ and $\theta = \tan^{-1} \frac{y}{x}$

Note:

- (i) Distance between the two complex numbers \mathbf{z}_1 & \mathbf{z}_2 is given by $|\mathbf{z}_1 \mathbf{z}_2|$.
- (ii) $|z z_0| = r$, represents a circle, whose centre is z_0 and radius is r.

Illustration 8 : Find the locus of :

(a)
$$|z - 1|^2 + |z + 1|^2 = 4$$

(b)
$$Re(z^2) = 0$$

Solution :

(a) Let
$$z = x + iy$$

$$\Rightarrow$$
 $(|x + iy - 1|)^2 + (|x + iy + 1|)^2 = 4$

$$\Rightarrow$$
 $(x - 1)^2 + y^2 + (x + 1)^2 + y^2 = 4$

$$\Rightarrow$$
 $x^2 - 2x + 1 + y^2 + x^2 + 2x + 1 + y^2 = 4 \Rightarrow $x^2 + y^2 = 1$$

Above represents a circle on complex plane with center at origin and radius unity.

(b) Let
$$z = x + iy$$

$$z^2 = x^2 - y^2 + 2xyi$$

$$\therefore \qquad \operatorname{Re}(z^2) = 0$$

$$\Rightarrow$$
 $x^2 - y^2 = 0 \Rightarrow y = \pm x$

Thus $Re(z^2) = 0$ represents a pair of straight lines passing through origin.

Illustration 9: If z is a complex number such that $z^2 = (\overline{z})^2$, then

(A) z is purely real

- (B) z is purely imaginary
- (C) either z is purely real or purely imaginary
- (D) none of these

Solution: Let
$$z = x + iy$$
, then its conjugate $\overline{z} = x - iy$

Given that
$$z^2 = (\overline{z})^2$$
 \Rightarrow $x^2 - y^2 + 2ixy = x^2 - y^2 - 2ixy$ \Rightarrow $4ixy = 0$

If
$$x \neq 0$$
 then $y = 0$ and if $y \neq 0$ then $x = 0$.

Illustration 10: Among the complex number z which satisfies $|z - 25i| \le 15$, find the complex numbers z having

(a) least positive argument

(b) maximum positive argument

(c) least modulus

(d) maximum modulus

Solution:

The complex numbers z satisfying the condition

$$|z - 25i| \le 15$$

are represented by the points inside and on the circle of radius 15 and centre at the point C(0, 25).

The complex number having least positive argument and maximum positive arguments in this region are the points of contact of tangents drawn from origin to the circle

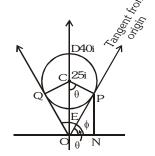

Here θ = least positive argument

and ϕ = maximum positive argument

:. In
$$\triangle OCP$$
, $OP = \sqrt{(OC)^2 - (CP)^2} = \sqrt{(25)^2 - (15)^2} = 20$

and
$$\sin \theta = \frac{OP}{OC} = \frac{20}{25} = \frac{4}{5}$$

$$\therefore \qquad \tan\theta = \frac{4}{3} \Rightarrow \theta = \tan^{-1}\left(\frac{4}{3}\right)$$

Thus, complex number at P has modulus 20 and argument $\theta = \tan^{-1} \left(\frac{4}{3} \right)$

$$\therefore z_p = 20(\cos\theta + i\sin\theta) = 20\left(\frac{3}{5} + i\frac{4}{5}\right)$$

$$z_p = 12 + 16i$$

Similarly
$$z_0 = -12 + 16i$$

From the figure, E is the point with least modulus and D is the point with maximum modulus.

Hence,
$$z_F = \overrightarrow{OE} = \overrightarrow{OC} - \overrightarrow{EC} = 25i - 15i = 10i$$

and
$$z_D = \overrightarrow{OD} = \overrightarrow{OC} + \overrightarrow{CD} = 25i + 15i = 40i$$

 - (A) a circle
- (B) a straight line

(c) Trigonometric / Polar Representation:

$$z = r (\cos \theta + i \sin \theta)$$
 where $|z| = r$; arg $z = \theta$; $\overline{z} = r (\cos \theta - i \sin \theta)$

Note : $\cos \theta + i \sin \theta$ is also written as CiS θ .

Euler's formula :

The formula $e^{ix} = \cos x + i \sin x$ is called Euler's formula.

It was introduced by Euler in 1748, and is used as a method of expressing complex numbers.

Also $\cos x = \frac{e^{ix} + e^{-ix}}{2}$ & $\sin x = \frac{e^{ix} - e^{-ix}}{2i}$ are known as Euler's identities.

(d) Exponential Representation:

Let z be a complex number such that $|z| = r \& arg z = \theta$, then $z = r.e^{i\theta}$

Illustration 11: Express the following complex numbers in polar and exponential form:

(i)
$$\frac{1+3i}{1-2i}$$
 (ii) $\frac{i-1}{\cos\frac{\pi}{3}+i\sin\frac{\pi}{3}}$

Solution :

(i) Let
$$z = \frac{1+3i}{1-2i} = \frac{1+3i}{1-2i} \times \frac{1+2i}{1+2i} = -1+i$$

$$|z| = \sqrt{(-1)^2 + 1^2} = \sqrt{2}$$

$$\tan \alpha = \left| \frac{1}{-1} \right| = 1 = \tan \frac{\pi}{4} \Rightarrow \alpha = \frac{\pi}{4}$$

 \therefore Re(z) < 0 and Im(z) > 0 \Rightarrow z lies in second quadrant.

$$\therefore \quad \theta = \arg(z) = \pi - \alpha = \pi - \frac{\pi}{4} = \frac{3\pi}{4}$$

Hence Polar form is

(ii) Let

$$\Rightarrow z = \frac{2(i-1)}{(1+i\sqrt{3})} \times \frac{(1-i\sqrt{3})}{(1-i\sqrt{3})} \Rightarrow z = \left(\frac{\sqrt{3}-1}{2}\right) + i\left(\frac{\sqrt{3}+1}{2}\right)$$

 \therefore Re(z) > 0 and Im(z) > 0 \Rightarrow z lies in first quadrant.

$$\tan \theta = \left| \frac{\sqrt{3} + 1}{\sqrt{3} - 1} \right| = \tan \frac{5\pi}{12} \Rightarrow \alpha = \frac{5\pi}{12}$$

Hence Polar form is
$$z = \sqrt{2} \left(\cos \frac{5\pi}{12} + i \sin \frac{5\pi}{12} \right)$$

and exponential form is $z = \sqrt{2}e^{5\pi/12}$

8. IMPORTANT PROPERTIES OF AMPLITUDE:

- (a) amp $(z_1, z_2) = amp z_1 + amp z_2 + 2 k\pi$; $k \in I$
- (b) $\operatorname{amp}\left(\frac{z_1}{z_2}\right) = \operatorname{amp}\ z_1 \operatorname{amp}\ z_2 + 2\ k\pi\ ; \quad k \in I$
- (c) $amp(z^n) = n \ amp(z) + 2k\pi \ ; \ n,k \in I$ where proper value of k must be chosen so that RHS lies in $(-\pi,\pi]$.

Illustration 13: Find amp z and |z| if $z = \left[\frac{(3+4i)(1+i)(1+\sqrt{3}i)}{(1-i)(4-3i)(2i)}\right]^2$.

Solution : $\operatorname{amp} z = 2 \left[\operatorname{amp} (3+4i) + \operatorname{amp} (1+i) + \operatorname{amp} (1+\sqrt{3}i) - \operatorname{amp} (1-i) - \operatorname{amp} (4-3i) - \operatorname{amp} (2i) \right] + 2k\pi$ where $k \in I$ and k chosen so that $\operatorname{amp} z$ lies in $(-\pi,\pi]$.

$$\Rightarrow \quad amp \ z = 2 \left[\tan^{-1} \frac{4}{3} + \frac{\pi}{4} + \frac{\pi}{3} - \left(-\frac{\pi}{4} \right) - \tan^{-1} \left(-\frac{3}{4} \right) - \frac{\pi}{2} \right] + 2k\pi$$

$$\Rightarrow \quad amp\ z =\ 2\bigg[\tan^{-1}\frac{4}{3} + \cot^{-1}\frac{4}{3} + \frac{\pi}{3}\bigg] +\ 2k\pi \quad \Rightarrow\ amp\ z = 2\bigg[\frac{\pi}{2} + \frac{\pi}{3}\bigg] + 2k\pi$$

Here let $z_1 = r_1(\cos\theta_1 + i\sin\theta_1), |z_1| = r_1$ Solution :

$$z_2 = r_2(\cos\theta_2 + i\sin\theta_2), |z_2| = r_2$$

$$\begin{aligned} \therefore & |(z_1 + z_2)|^2 = \left| (r_1 \cos \theta_1 + r_2 \cos \theta_2) + i (r_1 \sin \theta_1 + r_2 \sin \theta_2) \right|^2 \\ & = r_1^2 + r_2^2 + 2r_1r_2 \cos(\theta_1 - \theta_2) = |z_1|^2 + |z_2|^2 & \text{if } \cos(\theta_1 - \theta_2) = 0 \end{aligned}$$

$$\therefore \qquad \theta_1 - \theta_2 = \pm \frac{\pi}{2}$$

$$\Rightarrow$$
 amp (z_1) - amp (z_2) = $\pm \frac{\pi}{2}$ \Rightarrow amp $\left(\frac{z_1}{z_2}\right)$ = $\pm \frac{\pi}{2} \Rightarrow \frac{z_1}{z_2}$ is purely imaginary **Ans.** (B)

Illustration 16: z_1 and z_2 are two complex numbers such that $\frac{z_1-2z_2}{2-z_1z_2}$ is unimodular (whose modulus is one), while

 $\boldsymbol{z}_{_{9}}$ is not unimodular. Find $\mid\boldsymbol{z}_{_{1}}\mid$.

Here $\left| \frac{z_1 - 2z_2}{2 - z_1 z_2} \right| = 1 \implies \frac{\left| z_1 - 2z_2 \right|}{\left| z_2 - z_1 z_2 \right|} = 1$ Solution :

$$\Rightarrow$$
 $|z_1 - 2z_2| = |2 - z_1\overline{z_2}| \Rightarrow |z_1 - 2z_2|^2 = |2 - z_1\overline{z_2}|^2$

$$\Rightarrow (z_1 - 2z_2)(\overline{z_1 - 2z_2}) = (2 - z_1 \overline{z_2})(\overline{2 - z_1 \overline{z_2}})$$

$$\Rightarrow (z_1 - 2z_2)(\overline{z_1} - 2\overline{z_2}) = (2 - z_1\overline{z_2})(2 - \overline{z_1}z_2)$$

$$\Rightarrow z_1 z_1 - 2z_1 z_2 - 2z_2 z_1 + 4z_2 z_2 = 4 - 2z_1 z_2 - 2z_1 z_2 + z_1 z_1 z_2 z_2$$

$$\Rightarrow |z_1|^2 + 4|z_2|^2 = 4 + |z_1|^2 |z_2|^2 \Rightarrow |z_1|^2 - |z_1|^2 |z_2|^2 + 4|z_2|^2 - 4 = 0$$

$$\Rightarrow \left(\left| z_1 \right|^2 - 4 \right) \left(1 - \left| z_2 \right|^2 \right) = 0$$

But $|z_9| \neq 1$ (given)

We have, $\log_{1/2} \left(\frac{|z-1|+4}{3|z-1|-2} \right) > 1 = \log_{1/2} \left(\frac{1}{2} \right)$

$$\Rightarrow \frac{\left|z-1\right|+4}{3\left|z-1\right|-2} < \frac{1}{2} \qquad \qquad \left[\because \log_a x \text{ is a decreasing function if a } < 1\right]$$

 (C) $\sqrt{3} + 1$ (D) $\sqrt{5} + 1$

$$(C) \sqrt{3} + 1$$

D)
$$\sqrt{5} + 1$$

Solution: We have $|z| = \left|z - \frac{4}{z} + \frac{4}{z}\right| \le \left|z - \frac{4}{z}\right| + \frac{4}{|z|} = 2 + \frac{4}{|z|}$

$$\Rightarrow |z|^2 \le 2|z| + 4 \Rightarrow (|z| - 1)^2 \le 5$$

$$\Rightarrow$$
 $|z|-1 \le \sqrt{5}$ \Rightarrow $|z| \le \sqrt{5} + 1$

Therefore, the greatest value of |z| is $\sqrt{5}$ + 1 .

(C)
$$|z + 2| \le 6$$

9. SECTION FORMULA AND COORDINATES OF ORTHOCENTRE, CENTROID, CIRCUMCENTRE, INCENTRE OF A TRIANGLE:

VECTORIAL REPRESENTATION OF A COMPLEX NUMBER :

In complex number every point can be represented in terms of (a) position vector. If the point P represents the complex number z then, $\overrightarrow{OP} = z \& |\overrightarrow{OP}| = |z|$.

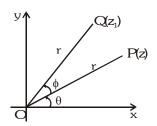

If $P(z_1)$ & $Q(z_2)$ be two complex numbers on argand plane then (b) \overrightarrow{PQ} represents complex number $z_2 - z_1$.

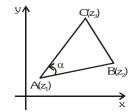

Note:

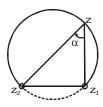

If $\overset{\rightarrow}{OP}=z=r\,e^{i\,\theta}$ then $\overset{\rightarrow}{OQ}=z_1=r\,e^{i\,(\theta\,+\,\phi)}=z.\,\,e^{i\phi}.$ If $\overset{\rightarrow}{OP}$ and $\overset{\rightarrow}{OQ}$ are of unequal magnitude then $\hat{OQ} = \hat{OP} \ e^{i\phi}$ i.e. $\frac{z_1}{|z_1|} = \frac{z}{|z|} e^{i\phi}$

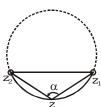

In general, if $\boldsymbol{z}_{1},~\boldsymbol{z}_{2},~\boldsymbol{z}_{3}$ be the three vertices of ΔABC then $\frac{z_3 - z_1}{z_2 - z_1} = \frac{|z_3 - z_1|}{|z_2 - z_1|} e^{i\alpha}. \text{ Here } \arg\left(\frac{z_3 - z_1}{z_2 - z_1}\right) = \alpha.$

 (2) $z_1^2 + z_2^2 + z_3^2 = 3 z_0^2$

Illustration 20: Complex numbers z_1 , z_2 , z_3 are the vertices A, B, C respectively of an isosceles right angled triangle with right angle at C. Show that $(z_1 - z_2)^2 = 2(z_1 - z_3)(z_3 - z_2)$.

Solution : In the isosceles triangle ABC, AC = BC and BC \perp AC. It means that AC is rotated through angle $\pi/2$ to occupy the position BC.

Hence we have,
$$\frac{z_2 - z_3}{z_1 - z_3} = e^{+i\pi/2} = +i$$
 \Rightarrow $z_2 - z_3 = +i(z_1 - z_3)$

$$\Rightarrow z_2^2 + z_3^2 - 2z_2z_3 = -(z_1^2 + z_3^2 - 2z_1z_3)$$

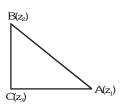

Illustration 21: If the vertices of a square ABCD are z_1 , z_2 , z_3 & z_4 then find z_3 & z_4 in terms of z_1 & z_2 . **Solution**: Using vector rotation at angle A

$$\frac{z_3 - z_1}{z_2 - z_1} = \frac{\left|z_3 - z_1\right|}{\left|z_2 - z_1\right|} e^{i\frac{\pi}{4}}$$

$$\therefore$$
 $|z_3 - z_1| = AC$ and $|z_2 - z_1| = AB$

Also AC =

 AB

$$\therefore \left| \mathbf{z}_3 - \mathbf{z}_1 \right| = \sqrt{2} \left| \mathbf{z}_2 - \mathbf{z}_1 \right|$$

$$\Rightarrow \frac{z_3 - z_1}{z_2 - z_1} = \sqrt{2} \left(\cos \frac{\pi}{4} + i \sin \frac{\pi}{4} \right)$$

$$\Rightarrow$$
 $z_3 - z_1 = (z_2 - z_1) (1 + i)$

$$\Rightarrow z_3 = z_1 + (z_2 - z_1) (1 + i)$$

Similarly
$$z_4 = z_2 + (1 + i)(z_1 - z_2)$$

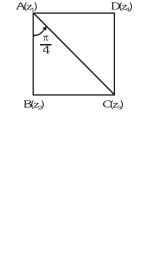

Illustration 22: Plot the region represented by $\frac{\pi}{3} \le \arg\left(\frac{z+1}{z-1}\right) \le \frac{2\pi}{3}$ in the Argand plane.

Solution: Let us take $arg\left(\frac{z+1}{z-1}\right) = \frac{2\pi}{3}$, clearly z lies on the minor arc of

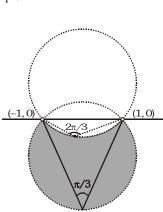

the circle passing through (1, 0) and (-1, 0). Similarly,

$$arg\left(\frac{z+1}{z-1}\right) = \frac{\pi}{3}$$
 means that 'z' is lying on the major arc of the

The value of $(\cos\theta + i\sin\theta)^n$ is $\cos\theta + i\sin\theta$ if 'n' is integer & it is one of the values of $(\cos\theta + i\sin\theta)^n$ if n is a rational number of the form p/q, where p & q are co-prime.

Note: Continued product of the roots of a complex quantity should be determined by using theory of equations.

$$\frac{1}{z_2} = \cos \beta - i \sin \beta, \ \frac{1}{z_3} = \cos \gamma - i \sin \gamma$$

$$\therefore \frac{1}{z_1} + \frac{1}{z_2} + \frac{1}{z_3} = (\cos\alpha + \cos\beta + \cos\gamma) - i(\sin\alpha + \sin\beta + \sin\gamma) \dots \dots (ii)$$

$$= 0 - 2z_1z_2z_3\left(\frac{1}{z_2} + \frac{1}{z_1} + \frac{1}{z_2}\right) = 0 - 2z_1z_2z_3 . 0 = 0$$

Equating real and imaginary parts on both sides,

$$\cos 2\alpha + \cos 2\beta + \cos 2\gamma = 0$$

(b) If
$$z_1 + z_2 + z_3 = 0$$
 then $z_1^3 + z_2^3 + z_3^3 = 3z_1z_2z_3$

$$\therefore (\cos\alpha + i\sin\alpha)^3 + (\cos\beta + i\sin\beta)^3 + (\cos\gamma + i\sin\gamma)^3$$

Equating imaginary parts on both sides, $\sin 3\alpha + \sin 3\beta + \sin 3\gamma = 3\sin(\alpha + \beta + \gamma)$

Illustration 25: If α , β , γ are roots of $x^3 - 3x^2 + 3x + 7 = 0$ (and ω is imaginary cube root of unity), then find the

value of
$$\frac{\alpha-1}{\beta-1} + \frac{\beta-1}{\gamma-1} + \frac{\gamma-1}{\alpha-1}$$
.

We have $x^3 - 3x^2 + 3x + 7 = 0$ Solution :

$$(x - 1)^3 + 8 = 0$$

$$(x - 1)^3 = (-2)^3$$

$$\Rightarrow \qquad \left(\frac{x-1}{-2}\right)^3 = 1 \quad \Rightarrow \quad \frac{x-1}{-2} = \left(1\right)^{1/3} = 1, \; \omega, \; \omega^2 \quad \text{(cube roots of unity)}$$

$$\therefore$$
 x = -1, 1 - 2 ω , 1 - 2 ω ²

Here
$$\alpha = -1$$
, $\beta = 1 - 2\omega$, $\gamma = 1 - 2\omega^2$

$$\alpha - 1 = -2$$
, $\beta - 1 = -2\omega$, $\gamma - 1 = -2\omega^2$

Then
$$\frac{\alpha-1}{\beta-1} + \frac{\beta-1}{\gamma-1} + \frac{\gamma-1}{\alpha-1} = \left(\frac{-2}{-2\omega}\right) + \left(\frac{-2\omega}{-2\omega^2}\right) + \left(\frac{-2\omega^2}{-2}\right) = \frac{1}{\omega} + \frac{1}{\omega} + \omega^2 = \omega^2 + \omega^2 + \omega^2$$

Therefore
$$\frac{\alpha-1}{\beta-1} + \frac{\beta-1}{\gamma-1} + \frac{\gamma-1}{\alpha-1} = 3\omega^2$$

14. THE SUM OF THE FOLLOWING SERIES SHOULD BE REMEMBERED

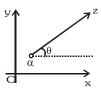

(a)
$$\cos \theta + \cos 2\theta + \cos 3\theta + \dots + \cos n\theta = \frac{\sin(n\theta/2)}{\sin(\theta/2)} \cos(\frac{n+1}{2})\theta$$
.

$$\text{(b)} \qquad \sin\,\theta + \sin\,2\,\theta + \sin\,3\,\theta + \ldots + \sin\,n\,\theta = \frac{\sin\left(n\theta/2\right)}{\sin\left(\theta/2\right)}\,\sin\left(\frac{n+1}{2}\right)\theta.$$

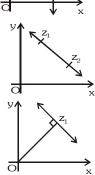

Note: If $\theta = (2\pi/n)$ then the sum of the above series vanishes.

15. STRAIGHT LINES & CIRCLES IN TERMS OF COMPLEX NUMBERS:

(a) $amp(z-\alpha) = \theta$ is a ray emanating from the complex point α and inclined at an angle θ to the x-axis.

- **(b)** |z-a| = |z-b| is the perpendicular bisector of the segment joining a & b.
- (c) The equation of a line joining $z_1 \& z_2$ is given by ; $z = z_1 + t (z_1 z_2)$ where t is a parameter.

(d) $z = z_1 (1 + it)$ where t is a real parameter, is a line through the point $z_1 &$

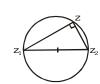

perpendicular to z_1 .

- (e) The equation of a line passing through $z_1 \& z_2$ can be expressed in the determinant form as $\begin{vmatrix} z & \overline{z} & 1 \\ z_1 & \overline{z}_1 & 1 \\ z_2 & \overline{z}_2 & 1 \end{vmatrix} = 0$. This is also the condition for three complex numbers to be collinear.
- (f) Complex equation of a straight line through two given points $z_1 \& z_2$ can be written as $z(\overline{z}_1 \overline{z}_2) \overline{z}(z_1 z_2) + (z_1 \overline{z}_2 \overline{z}_1 z_2) = 0$, which on manipulating takes the form as $\overline{\alpha}z + \alpha \overline{z} + r = 0$ where r is real and α is a non zero complex constant.

(h) $\operatorname{arg}\left(\frac{z-z_2}{z-z_1}\right) = \pm \frac{\pi}{2}$ or $(z-z_1)(\overline{z}-\overline{z}_2)+(z-z_2)(\overline{z}-\overline{z}_1)=0$

this equation represents the circle described on the line segment joining \mathbf{z}_1 & \mathbf{z}_2 as diameter.

(i) Condition for four given points z_1 , z_2 , z_3 & z_4 to be concyclic is, the number $\frac{z_3-z_1}{z_3-z_2} \cdot \frac{z_4-z_2}{z_4-z_1}$ is real. Hence the equation of a circle through 3 non collinear points z_1 , z_2 & z_3 can be taken as $\frac{\left(z-z_2\right)\left(z_3-z_1\right)}{\left(z-z_1\right)\left(z_3-z_2\right)} \text{ is real } \Rightarrow \frac{\left(z-z_2\right)\left(z_3-z_1\right)}{\left(z-z_1\right)\left(z_2-z_2\right)} = \frac{\left(\overline{z}-\overline{z}_2\right)\left(\overline{z}_3-\overline{z}_1\right)}{\left(\overline{z}-\overline{z}_1\right)\left(\overline{z}_3-\overline{z}_2\right)}$

Illustration 27: If z is a point on the Argand plane such that |z-1|=1, then $\frac{z-2}{z}$ is equal to

(B) cot (arg z)

(A) tan (arg z)

Since |z - 1| = 1, \therefore let $z - 1 = \cos \theta + i \sin \theta$

Then, $z-2 = \cos \theta + i \sin \theta - 1$

$$=-2\sin^2\frac{\theta}{2}+2i\sin\frac{\theta}{2}\cos\frac{\theta}{2}=2i\sin\frac{\theta}{2}\bigg(\cos\frac{\theta}{2}+i\sin\frac{\theta}{2}\bigg) \quad \ \ \text{(i)}$$

and $z = 1 + \cos \theta + i \sin \theta$

From (i) and (ii), we get

$$|z_1 + z_2|^2 \le (1 + C) |z_1|^2 + (1 + C^{-1})|z_2|^2$$

i.e.

$$\left(\sqrt{C}\left|z_1\right| - \frac{1}{\sqrt{C}}\left|z_2\right|\right)^2 \ge 0$$
 which is always true.

Illustration 30 : If $\theta \in [\pi/6, \pi/3]$, i = 1, 2, 3, 4, 5 and $z^4 \cos\theta_1 + z^3 \cos\theta_2 + z^2 \cos\theta_3 + z \cos\theta_4 + \cos\theta_5 = 2\sqrt{3}$, then

show that
$$|z| > \frac{3}{4}$$

Given that $\cos \theta_1 \cdot z^4 + \cos \theta_2 \cdot z^3 + \cos \theta_3 \cdot z^2 + \cos \theta_4 \cdot z + \cos \theta_5 = 2\sqrt{3}$ Solution :

or
$$\left|\cos\theta_1.z^4 + \cos\theta_2.z^3 + \cos\theta_3.z^2 + \cos\theta_4.z + \cos\theta_5\right| = 2\sqrt{3}$$

$$2\sqrt{3} \le |\cos\theta_1.z^4| + |\cos\theta_2.z^3| + |\cos\theta_3.z^2| + |\cos\theta_4.z| + |\cos\theta_5|$$

$$\theta_{i} \in [\pi/6, \pi/3]$$

$$\therefore \qquad \frac{1}{2} \le \cos \theta_{i} \le \frac{\sqrt{3}}{2}$$

$$2\sqrt{3} \le \frac{\sqrt{3}}{2}|z|^4 + \frac{\sqrt{3}}{2}|z|^3 + \frac{\sqrt{3}}{2}|z|^2 + \frac{\sqrt{3}}{2}|z| + \frac{\sqrt{3}}{2}$$

$$\Rightarrow 3 \le |z|^4 + |z|^3 + |z|^2 + |z|$$

$$\Rightarrow$$
 3 < $|z| + |z|^2 + |z|^3 + |z|^4 + |z|^5 + \dots \infty$

$$\Rightarrow 3 < \frac{|z|}{1 - |z|} \Rightarrow 3 - 3|z| \le |z|$$

$$\Rightarrow 4|z| > 3$$

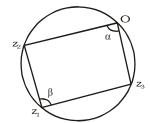

$$|z| > \frac{3}{4}$$

Illustration 31: If z_1 , z_2 , z_3 are complex numbers such that $\frac{2}{z_1} = \frac{1}{z_2} + \frac{1}{z_3}$, show that the points represented by $\boldsymbol{z}_1, \boldsymbol{z}_2, \boldsymbol{z}_3$ lie on a circle passing through the origin.

Solution :

We have,
$$\frac{2}{z_1} = \frac{1}{z_2} + \frac{1}{z_2} \implies \frac{1}{z_1} - \frac{1}{z_2} = \frac{1}{z_3} - \frac{1}{z_1} \implies \frac{z_2 - z_1}{z_1 z_2} = \frac{z_1 - z_3}{z_1 z_3}$$

$$\Rightarrow \frac{z_2 - z_1}{z_3 - z_1} = \frac{-z_2}{z_3} \Rightarrow \arg\left(\frac{z_2 - z_1}{z_3 - z_1}\right) = \arg\left(\frac{-z_2}{z_3}\right)$$

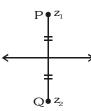

$$\arg \left(\frac{z_2-z_1}{z_3-z_1}\right) = \pi + \arg \left(\frac{z_2}{z_3}\right) \implies \text{ or } \beta = \pi - \arg \frac{z_3}{z_2} = \pi - \alpha = \alpha + \beta = \pi$$

Thus the sum of a pair of opposite angle of a quadrilateral is 180. Hence, the points 0, z_1 , z_2 and z₃ are the vertices of a cyclic quadrilateral i.e. lie on a circle.

Illustration 32: Two given points P & Q are the reflection points w.r.t. a given straight line if the given line is the right bisector of the segment PQ. Prove that the two points denoted by the complex numbers $z_1 \& z_2$ will be the reflection points for the straight line $\overline{\alpha}z + \alpha \overline{z} + r = 0$ if and only if ;

 $\overline{\alpha}\,z_1 + \alpha\,\overline{z}_2 + r = 0$, where r is real and α is non zero complex constant.

Solution:

Let $P(z_1)$ is the reflection point of $Q(z_2)$ then the perpendicular bisector of $z_1 & z_2$ must be the line

Now perpendicular bisector of $z_1 \& z_2$ is, $|z - z_1| = |z - z_2|$

or
$$(z - z_1)(\overline{z} - \overline{z}_1) = (z - z_2)(\overline{z} - \overline{z}_2)$$

$$-z\overline{z}_1 - z_1\overline{z} + z_1\overline{z}_1 = -z\overline{z}_2 - z_2\overline{z} + z_2\overline{z}_2$$

 $(z\overline{z}$ cancels on either side)

or
$$\left(\overline{z}_2 - \overline{z}_1\right)z + \left(z_2 - z_1\right)\overline{z} + z_1\overline{z}_1 - z_2\overline{z}_2 = 0$$

..... (ii)

Comparing (i) & (ii)
$$\frac{\overline{\alpha}}{\overline{z}_2 - \overline{z}_1} = \frac{\alpha}{z_2 - z_1} = \frac{r}{z_1 \overline{z}_1 - z_2 \overline{z}_2} = \lambda$$

$$\therefore \quad \overline{\alpha} = \lambda (\overline{z}_2 - \overline{z}_1)$$

$$\alpha = \lambda (z_2 - z_1) \qquad \dots \qquad \text{(iv)}$$

Multiplying (iii) by z_1 ; (iv) by \overline{z}_2 and adding

$$\overline{\alpha}z_1^{} + \alpha\overline{z}_2^{} + r = 0$$

Note that we could also multiply (iii) by z_2 & (iv) by \overline{z}_1 & add to get the same result.

Hence $\overline{\alpha}z_1 + \alpha \overline{z}_2 + r = 0$

Again, let $\overline{\alpha}z_1 + \alpha\overline{z}_2 + r = 0$ is true w.r.t. the line $\overline{\alpha}z + \alpha\overline{z} + r = 0$.

Subtracting $\overline{\alpha}(z-z_1) + \alpha(\overline{z}-\overline{z}_2) = 0$

or
$$|(z-z_1)||\overline{\alpha}| = |\alpha||(\overline{z}-\overline{z}_2)|$$
 or $|z-z_1| = |\overline{z-z_2}| = |z-z_2|$

Hence 'z' lies on the perpendicular bisector of joins of $\boldsymbol{z_1}$ & $\boldsymbol{z_2}.$

COMPREHENSION BASED QUESTIONS

Comprehension # 1:

Let z be any complex number. To factorise the expression of the form $z^n - 1$, we consider the equation z^n = 1. This equation is solved using De moiver's theorem. Let 1, α_1 , α_2 ,...... α_{n-1} be the roots of this equation, then $z^n-1=(z-1)(z-\alpha_1)(z-\alpha_2)....(z-\alpha_{n-1})$ This method can be generalised to factorize any expression of the form $z^n - k^n$.

for example,
$$z^7 + 1 = \prod_{m=0}^{6} \left(z - C i S \left(\frac{2m\pi}{7} + \frac{\pi}{7} \right) \right)$$

This can be further simplified as

$$z^{7} + 1 = (z + 1)\left(z^{2} - 2z\cos\frac{\pi}{7} + 1\right)\left(z^{2} - 2z\cos\frac{3\pi}{7} + 1\right)\left(z^{2} - 2z\cos\frac{5\pi}{7} + 1\right) \dots \dots \dots \dots (i)$$

These factorisations are useful in proving different trigonometric identities e.g. in eqaution (i) if we put z = i, then equation (i) becomes

$$(1-i) = (i+1)\left(-2i\cos\frac{\pi}{7}\right)\left(-2i\cos\frac{3\pi}{7}\right)\left(-2i\cos\frac{5\pi}{7}\right)$$

i.e.
$$\cos \frac{\pi}{7} \cos \frac{3\pi}{7} \cos \frac{5\pi}{7} = -\frac{1}{8}$$

On the basis of above information, answer the following questions :

- 1. If the expression z^5 32 can be factorised into linear and quadratic factors over real coefficients as $(z^5-32)=(z-2)(z^2-pz+4)(z^2-qz+4)$, where p>q, then the value of p^2-2q
